Create Virtual Host on Mamp

Open your terminal and edit your hosts:
    sudo vim /etc/hosts

Add your desired host name after local host:

 ex. 127.0.0.1 hkipulomas.local

Go to httpd.conf and enable virtual host like below

Virtual Hosts
Include /Applications/MAMP/conf/apache/extra/httpd-vhosts.conf

Open Applications/MAMP/conf/apache/extra/httpd-vhosts.conf. This is where you define the virtual hosts.

Edit both examples. Virtual hosts override the existing localhost, so the first one needs to re-establish localhost. Edit the second one for the virtual host you want to add. Only the DocumentRoot and ServerName directives are required.

To add a virtual host for hkipulomas, the edited definitions should look like this:

```
<VirtualHost *:80>
    DocumentRoot /Applications/MAMP/htdocs
    ServerName localhost
</VirtualHost>

<VirtualHost *:80>
    DocumentRoot "/Users/username/Sites/Hkipulomas"
    ServerName hkipulomas.local
</VirtualHost>
```
